## Drag polar, stability derivatives and characteristic roots of a

jet airplane - 4
Lecture 40

## Topics

6.5 Estimation of $\mathrm{C}_{\mathrm{l}_{\mathrm{p}}}$
6.6 Estimation of $\mathrm{C}_{\mathrm{np}}$
6.7 Estimation of $\mathrm{C}_{\mathrm{Yr}}$
6.8 Estimation of $\mathrm{C}_{\mathrm{lr}}^{\prime}$
6.9 Estimation of $\mathrm{C}_{\text {nr }}$

## 7. Comparison of estimated values with those in Ref. 3

## 8. Stability analysis

8.1 Equations for longitudinal motion
8.2 Equations for lateral Motion
8.3 Flight condition, mass and moments of inertia
8.4 Analysis of longitudinal motion
8.5 Analysis of lateral motion

### 6.5 Estimation of $\mathrm{C}_{\mathrm{lp}}^{\prime}$

From Eq. 8.2 of Ref. 2
$\mathrm{C}_{\mathrm{pp}}^{\prime}=\mathrm{C}_{\mathrm{lpWB}}^{\prime}+\mathrm{C}_{\mathrm{ppH}}^{\prime}+\mathrm{C}_{\mathrm{lpV}}^{\prime}$
$\mathrm{C}_{\mathrm{lpWB}}^{\prime} \approx \mathrm{C}_{\mathrm{lpW}}^{\prime}=\beta\left(\frac{\mathrm{C}_{\mathrm{lp}}^{\prime}}{\kappa}\right) \kappa / \beta$
$\beta \mathrm{C}_{\mathrm{lp}}^{\prime} / \kappa$ depends on $\beta \mathrm{A} / \kappa$ and $\Lambda_{\beta}$
$\kappa=(2$-D slope of lift curve $) / 2 \pi \approx 1$ (assumed)
$\beta$ A $/ \kappa=0.6 \times 6.46 / 1=3.876$
$\Lambda_{\beta}=\tan ^{-1}\left(\tan \Lambda_{\mathrm{c} / 4} / \beta\right)=53^{0}$

For $\lambda=0.29, \beta C_{1 \mathrm{p}}^{\prime} / \kappa=-0.262$ from Fig 8.1 of Ref.2,

$$
\mathrm{C}_{\mathrm{lpW}}^{\prime}=-0.262 / 0.6=-0.436
$$

$$
\mathrm{C}_{\mathrm{lpH}}^{\prime}=0.5\left(\mathrm{C}_{\mathrm{lp}}^{\prime} / \kappa\right)_{\mathrm{H}} \frac{\mathrm{~S}_{\mathrm{H}}}{\mathrm{~S}}\left(\frac{\mathrm{~b}_{\mathrm{H}}}{\mathrm{~b}}\right)^{2}
$$

For horizontal tail $\beta \mathrm{A} / \kappa=(0.6 \times 3.64) / 1=2.184$

$$
\left(\Lambda_{\beta}\right)_{\mathrm{H}}=\tan ^{-1}(\tan 35.3 / 0.6)=49.6^{0}
$$

For $\lambda=0.266:\left(\beta \mathrm{C}_{\mathrm{lp}}^{\prime} / \kappa\right)_{\mathrm{H}}=-0.18$ from Fig 8.1 of Ref. 2

$$
\begin{aligned}
& \left(\mathrm{C}_{\mathrm{lp}}^{\prime}\right)_{\mathrm{H}}=-0.5 \times \frac{0.18}{0.6} \times \frac{135.07}{550.5}\left(\frac{22.18}{59.64}\right)^{2}=-0.0050 \\
& \mathrm{C}_{\mathrm{lpv}}^{\prime}=2\left(\mathrm{Z}_{\mathrm{v}} / \mathrm{b}\right)^{2} \mathrm{C}_{\mathrm{Y} \beta \mathrm{v}}=2 \times\left(\frac{6.35}{59.64}\right)^{2}(-0.636)=-0.0145
\end{aligned}
$$

Hence, $\mathrm{C}_{\mathrm{lp}}^{\prime}=-0.436-0.005-0.0145=-0.458$.
Based on area of $511 \mathrm{~m}^{2}$ this is -0.494 . The value from Ref. 3 is -0.34 . The graphs of Ref. 3 show that value of $\mathrm{C}_{\mathrm{lp}}^{\prime}$ does not vary much with Mach number, but the theoretical method shows a significant dependence on flight Mach number. If $\mathrm{M}=0.0$ then Fig. 8.1 of Ref. 2 gives a value of $\mathrm{C}_{\mathrm{lpw}}^{\prime}=-0.32$.

### 6.6 Estimation of $\mathrm{C}_{\mathrm{np}}$

From Eq.(8.6) of Ref. 2

$$
\mathrm{C}_{\mathrm{np}}=\mathrm{C}_{\mathrm{np} \mathrm{~W}}+\mathrm{C}_{\mathrm{npV}}
$$

Where,

$$
\mathrm{C}_{\mathrm{npW}}=-\mathrm{C}_{\mathrm{lpW}}^{\prime} \tan \alpha-\left[-\mathrm{C}_{\mathrm{lp}}^{\prime} \tan \alpha-\left(\frac{\mathrm{C}_{\mathrm{np}}}{\mathrm{C}_{\mathrm{L}}}\right)_{\mathrm{C}_{\mathrm{L}}=0, \mathrm{M}} \mathrm{C}_{\mathrm{L}}\right]+\left(\frac{\Delta \mathrm{C}_{\mathrm{np}}}{\theta}\right) \theta+\left(\frac{\Delta \mathrm{C}_{\mathrm{np}}}{\alpha_{\delta_{\mathrm{f}}} \delta_{\mathrm{f}}}\right) \alpha_{\delta_{\mathrm{f}}} \delta_{\mathrm{f}}
$$

Now, $\mathrm{C}_{\mathrm{lpW}}^{\prime}=-0.436$ from section 6.5
$\alpha=4.5^{0}, C_{L}=0.616, \mathrm{C}_{\mathrm{lp}}^{\prime}=-0.458$

From Eq.(8.8) of Ref. 2

$$
\left(\frac{C_{n p}}{C_{L}}\right)_{C L=0, \mathrm{M}}=K\left(\frac{C_{n p}}{C_{L}}\right)_{\mathrm{CL}=0, \mathrm{M}=0}
$$

Where,
$\mathrm{K}=\left(\frac{\mathrm{A}+4 \cos \Lambda_{\mathrm{c} / 4}}{\mathrm{AB}+4 \cos \Lambda_{\mathrm{c} / 4}}\right)\left[\frac{\mathrm{AB}+\frac{1}{2}\left(\mathrm{AB}+\cos \Lambda_{\mathrm{c} / 4}\right) \tan ^{2} \Lambda_{\mathrm{c} / 4}}{\mathrm{~A}+\frac{1}{2}\left(\mathrm{~A}+\cos \Lambda_{\mathrm{c} / 4}\right) \tan ^{2} \Lambda_{\mathrm{c} / 4}}\right]$
where, $\mathrm{B}=\sqrt{ }\left(1-\mathrm{M}^{2} \cos ^{2} \Lambda_{\mathrm{c} / 4}\right)=\left(1-0.8^{2} \cos ^{2} 38.5\right)=0.78$

For $\mathrm{A}=6.46$, we get $\mathrm{K}=0.9238$

From Eq.(8.10) of Ref. 2
$\left(\mathrm{C}_{\mathrm{np}}\right)_{\mathrm{CL}=0, \mathrm{M}=0}=\frac{(-1 / 6)\left[\mathrm{A}+6\left(\mathrm{~A}+\cos \Lambda_{\mathrm{c} / 4}\right)\left(\frac{\overline{\mathrm{x}}}{\overline{\mathrm{c}}} \frac{\tan \Lambda_{\mathrm{c} / 4}}{\mathrm{~A}}+\frac{\tan ^{2} \Lambda_{\mathrm{c} / 4}}{12}\right]\right.}{\mathrm{A}+4 \cos \Lambda_{\mathrm{c} / 4}}$
Since, c.g. lies at a.c. of wing, $\overline{\mathrm{x}} / \overline{\mathrm{c}}=0$ and
$\left(C_{n p}\right)_{C_{L}=0, M=0}=-0.1526$
Hence, $\left(C_{n p} / C_{L}\right)_{C_{L}=0, \mathrm{M}}=0.9238 \times(-0.1526)=-0.141$

For $\mathrm{A}=6.46$ and $\lambda=0.29, \Delta \mathrm{C}_{\mathrm{np}} / \theta=0.00021$ from Fig.8.2 of Ref.2.
$\delta_{\mathrm{f}}=$ flap deflection $=0($ assumed $)$
$\theta=-3^{0}$ (assumed).

Hence, $\mathrm{C}_{\mathrm{npW}}=0.436 \times \tan 4.5^{\circ}-\left[0.458 \tan 4.5^{\circ}+0.141 \times 0.616\right]+.00021 \times(-3)=-0.0896$
$\mathrm{C}_{\mathrm{npV}}=\left(-2 / \mathrm{b}^{2}\right)\left(l_{\mathrm{V}} \cos \alpha+\mathrm{Z}_{\mathrm{V}} \sin \alpha\right)\left(\frac{\mathrm{Z}_{\mathrm{V}} \cos \alpha-l_{\mathrm{V}} \sin \alpha}{\mathrm{b}}\right) \mathrm{C}_{\mathrm{y} \beta \mathrm{V}}$

$$
\begin{aligned}
& =-\frac{2}{59.64^{2}}(-0.636)\left(28.35 \cos 4.5^{0}+6.35 \sin 4.5^{\circ}\right) \times\left(6.35 \cos 4.5^{0}-28.35 \sin 4.5^{0}\right) \\
& =0.0405
\end{aligned}
$$

Hence, $\mathrm{C}_{\mathrm{np}}=-0.0896+0.0405=-0.0491$

Based on an area of $511 \mathrm{~m}^{2}, \mathrm{C}_{\mathrm{np}}=-0.0529$

The value of $\mathrm{C}_{\mathrm{np}}$ from Ref. 3 is -0.044

### 6.7 Estimation of $\mathrm{C}_{\mathrm{Yr}}$

From Eq.(9.1) of Ref. 2
$\mathrm{C}_{\mathrm{Yr}} \approx \mathrm{C}_{\mathrm{Yrv}}$
where, $\mathrm{C}_{\mathrm{Yrv}}=-(2 / \mathrm{b})\left(l_{\mathrm{v}} \cos \alpha+\mathrm{Z}_{\mathrm{v}} \sin \alpha\right) \mathrm{C}_{\mathrm{Y} \beta \mathrm{v}}$

$$
=-(2 / 59.64)\left(28.35 \cos 4.5^{0}+6.35 \sin 4.5^{0}\right)(-0.636)=0.613
$$

### 6.8 Estimation of $\mathrm{C}^{\prime}{ }_{\mathrm{Ir}}$

From Eq.(9.3) of Ref. 2
$\mathrm{C}_{\mathrm{lr}}^{\prime}=\mathrm{C}_{\mathrm{lrW}}^{\prime}+\mathrm{C}_{\mathrm{lrV}}^{\prime}$
Where, $\mathrm{C}_{\mathrm{lrW}}^{\prime}=\mathrm{C}_{\mathrm{L}}\left(\frac{\mathrm{C}_{\text {lr }}^{\prime}}{\mathrm{C}_{\mathrm{L}}}\right)_{\mathrm{CL}=0, \mathrm{M}}+\left(\frac{\Delta \mathrm{C}_{\mathrm{lr}}^{\prime}}{\Gamma}\right) \Gamma+\left(\frac{\Delta \mathrm{C}_{\text {lr }}^{\prime}}{\theta}\right) \theta+\left(\frac{\Delta \mathrm{C}_{\text {lr }}^{\prime}}{\alpha_{\delta f} \delta_{\mathrm{f}}}\right) \alpha_{\delta \mathrm{f}} \delta_{\mathrm{f}} ;$
$\delta_{f}=$ flat deflection; it is zero in the present case.
Now, $\left(\mathrm{C}_{\text {lr }}^{\prime} / \mathrm{C}_{\mathrm{L}}\right)_{\mathrm{CL}=0, \mathrm{M}}=\mathrm{K}_{1}\left(\frac{\mathrm{C}_{\text {lr }}^{\prime}}{\mathrm{C}_{\mathrm{L}}}\right) \mathrm{C}_{\mathrm{L}=0, \mathrm{M}=0}$
Where, $\mathrm{K}_{1}=\frac{1+\frac{\mathrm{A}\left(1-\mathrm{B}^{2}\right)}{2 \mathrm{~B}\left(\mathrm{AB}+2 \cos \Lambda_{\mathrm{c} / 4}\right)}+\frac{\mathrm{AB}+2 \cos \Lambda_{\mathrm{c} / 4}}{\mathrm{AB}+4 \cos \Lambda_{\mathrm{c} / 4}} \frac{\tan ^{2} \Lambda_{\mathrm{c} / 4}}{8}}{1+\frac{\mathrm{A}+2 \cos \Lambda_{\mathrm{c} / 4}}{\mathrm{~A}+4 \cos \Lambda_{\mathrm{c} / 4}}+\frac{\tan ^{2} \Lambda_{\mathrm{c} / 4}}{8}}$

For $\mathrm{A}=6.44, \mathrm{~B}=\sqrt{\left(1-\mathrm{M}^{2} \cos ^{2} \Lambda_{\mathrm{c} / 4}\right)}=0.78, \Lambda_{\mathrm{c} / 4}=38.5^{0}$.

Substituting, gives $\mathrm{K}_{1}=1.227$
From Fig 9.1 of Ref. $2\left(\mathrm{C}_{\mathrm{lr}}^{\prime}\right)_{\mathrm{CL}=0, \mathrm{M}=0}=0.345$
Hence, $\quad C_{L}\left(\frac{C_{\text {lr }}^{\prime}}{C_{L}}\right)_{\mathrm{CL}=0, \mathrm{M}}=1.227 \times 0.345 \times 0.616=0.261$
Using Eq. (9.7 ) of Ref.2,
$\Gamma\left(\frac{\Delta \mathrm{C}_{\mathrm{lr}}^{\prime}}{\Gamma}\right)=\frac{7}{57.3} \frac{1}{12} \frac{\pi \times 6.46 \sin 38.5}{6.46+4 \cos 38.5}=0.0134$

From Fig.9.2, $\left(\mathrm{C}_{\mathrm{lr}}^{\prime} / \theta\right)=-0.0136$

Hence, $\theta\left(\Delta \mathrm{C}_{\mathrm{lr}}^{\prime} / \theta\right)=-0.0136 \times(-3)=0.0408$

Hence, $\mathrm{C}_{\text {lrW }}^{\prime}=0.261+0.0134+0.0408=0.315$
$\mathrm{C}_{\mathrm{IrV}}^{\prime}=-\left(2 / \mathrm{b}^{2}\right)\left(l_{\mathrm{v}} \cos \alpha+\mathrm{Z}_{\mathrm{v}} \sin \alpha\right)\left(\mathrm{Z}_{\mathrm{v}} \cos \alpha-l_{\mathrm{v}} \sin \alpha\right) \mathrm{C}_{\mathrm{y} \beta \mathrm{V}}=0.0405$

Hence, $\mathrm{C}_{\mathrm{lr}}^{\prime}=0.315+0.0405=0.3505$

Based on an area of $511 \mathrm{~m}^{2}, \mathrm{C}_{\mathrm{lr}}^{\prime}=0.378$

The value of $\mathrm{C}_{\mathrm{lr}}^{\prime}$ from Ref. 3 is 0.31
6.9 Estimation of $\mathrm{C}_{\mathrm{nr}}$

From Eq.(9.9) of Ref.2.
$\mathrm{C}_{\mathrm{nr}}=\mathrm{C}_{\mathrm{nrW}}+\mathrm{C}_{\mathrm{nrV}}$

Where, $C_{n r W}=\left(\frac{C_{n r}}{C_{L}^{2}}\right) C_{L}^{2}+\left(\frac{C_{n r}}{C_{D 0}}\right) C_{D 0}$
From Fig.9.4 $\left(\mathrm{C}_{\mathrm{nr}} / \mathrm{C}_{\mathrm{L}}^{2}\right)=0$
$C_{n r} / C_{D 0}=-0.44$ from Fig 9.5 of Ref. 2
$\mathrm{C}_{\mathrm{D} 0}=0.014$

Hence, $\mathrm{C}_{\mathrm{nrW}}=-0.44 \times 0.014=-0.00616$

$$
\begin{aligned}
\mathrm{C}_{\mathrm{nrV}} & =\left(2 / \mathrm{b}^{2}\right)\left(l_{\mathrm{v}} \cos \alpha+\mathrm{Z}_{\mathrm{v}} \sin \alpha\right)^{2} \mathrm{C}_{\mathrm{y} \beta \mathrm{v}} \\
& =\left(2 / 59.64^{2}\right)(28.35 \cos 4.5+6.35 \sin 4.5)^{2} \times(-0.636)=-0.296
\end{aligned}
$$

Hence, $\mathrm{C}_{\mathrm{nr}}=-0.00616-0.296=-0.302$
Based on an area of $511 \mathrm{~m}^{2}, \mathrm{C}_{\mathrm{nr}}=-0.325$
From Ref. $3, C_{n r}=-0.34$

## 7 Comparison of estimated values with those in Ref. 3

In Table3, the values of derivatives estimated using references Ref. 1 and Ref. 2 are compared with the values for flexible airplane given in Ref.3. In most of the cases, agreement is within $\pm 10 \%$.The notable exceptions are $\mathrm{C}_{\mathrm{L} \alpha}, \mathrm{C}_{\mathrm{mu}}, \mathrm{C}_{\mathrm{m} \dot{\alpha}} \mathrm{C}_{\mathrm{lp}}^{\prime}$ and $\mathrm{C}_{\mathrm{lr}}^{\prime}$. Reference 9 gives (page 4.114) the level of inaccuracy in the estimated values of various derivatives. The deviations found here are fairly within those limits.

The rather large deviation in the estimated values of $\mathrm{C}_{\mathrm{L} \alpha}$ and $\mathrm{C}_{\mathrm{lp}}^{\prime}$ as compared to those of Ref. 3 appear to be due to inaccurate correction for the effect of Mach number. The theoretical correction for $\mathrm{C}_{\mathrm{L} \alpha}$ is based on Prandtl-Glauert rule as applied to wing. This gives about $20 \%$ increase in the value of $\mathrm{C}_{\mathrm{L} \alpha}$ when Mach number changes from zero to 0.8 . The results for flexible airplane show (Figure on p. 220 of Ref.3) that there is a slight decrease in the value of $\mathrm{C}_{\mathrm{L} \alpha}$ between Mach number zero and 0.8. In a similar manner, $\mathrm{C}_{\mathrm{lp}}^{\prime}$ depends mainly on the wing. The estimated value of $\mathrm{C}_{\mathrm{lp}}^{\prime}$ at $\mathrm{M}=0$ would be - 0.32 which is fairly close to the value for flexible airplane. Here, again (figure on p. 225 of Ref.3) $\mathrm{C}_{\mathrm{lp}}^{\prime}$ does not vary appreciably with Mach number for the flexible airplane.

TABLE 3: Comparison of estimated derivatives with those in Ref. 3

## 8. Stability analysis

The stability derivatives have been evaluated using the methods prescribed in Ref.2.The equations of motion using small perturbation theory approach are as follows (Ref.10, Chapters $4 \& 5$ ).
8.1 Equations for longitudinal motion

$$
\begin{align*}
& \left(\frac{\mathrm{d}}{\mathrm{dt}}-\mathrm{X}_{\mathrm{u}}\right) \Delta \mathrm{u}-\mathrm{X}_{\mathrm{w}} \Delta \mathrm{w}+\left(\mathrm{g} \cos \left(\theta_{0}\right)\right) \Delta \theta=\mathrm{X}_{\delta} \Delta \delta+\mathrm{X}_{\dot{\delta} \mathrm{T}} \Delta \delta_{\mathrm{T}}  \tag{1}\\
& -\mathrm{Z}_{\mathrm{u}} \Delta \mathrm{u}+\left(\left(1-\mathrm{Z}_{\dot{w}}\right) \frac{\mathrm{d}}{\mathrm{dt}}-\mathrm{Z}_{\mathrm{w}}\right) \Delta \mathrm{w}-\left(\left(\mathrm{u}_{0}+\mathrm{Z}_{\mathrm{q}}\right) \frac{\mathrm{d}}{\mathrm{dt}}-\mathrm{g} \sin \theta\right) \Delta \theta=\mathrm{Z}_{\delta} \Delta \delta+\mathrm{Z}_{\delta \mathrm{T}} \Delta \delta_{\mathrm{T}}  \tag{2}\\
& -\mathrm{M}_{\mathrm{u}} \Delta \mathrm{u}-\left(\mathrm{M}_{\dot{\mathrm{w}}} \frac{\mathrm{~d}}{\mathrm{dt}}+\mathrm{M}_{\mathrm{w}}\right) \Delta \mathrm{w}+\left(\frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}}-\mathrm{M}_{\mathrm{q}} \frac{\mathrm{~d}}{\mathrm{dt}}\right) \Delta \theta=\mathrm{M}_{\delta} \Delta \delta+\mathrm{M}_{\delta \mathrm{T}} \Delta \delta_{\mathrm{T}} \tag{3}
\end{align*}
$$

These Equations can be expressed in state space variable form (without control input) as:
$\dot{\mathbf{X}}=\mathbf{A X}$
$\left(\begin{array}{c}\Delta \dot{\mathrm{u}} \\ \Delta \dot{\mathrm{w}} \\ \Delta \dot{\mathrm{q}} \\ \Delta \dot{\theta}\end{array}\right)=\left(\begin{array}{cccc}\mathrm{X}_{\mathrm{u}} & \mathrm{X}_{\mathrm{w}} & 0 & -\mathrm{g} \\ \mathrm{Z}_{\mathrm{u}} & \mathrm{Z}_{\mathrm{w}} & \mathrm{u}_{0} & 0 \\ \mathrm{M}_{\mathrm{u}}+\mathrm{M}_{\dot{\mathrm{w}}} \mathrm{Z}_{\mathrm{u}} & \mathrm{M}_{\mathrm{w}}+\mathrm{M}_{\dot{\mathrm{w}}} \mathrm{Z}_{\mathrm{w}} & \mathrm{M}_{\mathrm{q}}+\mathrm{M}_{\dot{\mathrm{w}}} \mathrm{U}_{0} & 0 \\ 0 & 0 & 1 & 0\end{array}\right)\left(\begin{array}{c}\Delta \mathrm{u} \\ \Delta \mathrm{w} \\ \Delta \mathrm{q} \\ \Delta \theta\end{array}\right)$
where,
$X_{u}=-\left(C_{D u}+2 C_{D}\right) Q S / \mathrm{mu}_{0}$
$Z_{u}=-\left(C_{L u}+2 C_{L}\right) Q S / m u_{0}$
$\mathrm{M}_{\mathrm{u}}=\mathrm{C}_{\mathrm{mu}}\left(\mathrm{QS} \overline{\mathrm{c}} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{yy}}\right)$
$X_{w}=-\left(C_{D \alpha}-C_{L}\right) Q S / m u_{0}$
$Z_{w}=-\left(C_{L \alpha}+C_{D}\right) Q S / \mathrm{mu}_{0}$
$\mathrm{M}_{\mathrm{w}}=\mathrm{C}_{\mathrm{m} \alpha}\left(\mathrm{QS} \overline{\mathrm{c}} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{yy}}\right)$
$\mathrm{M}_{\dot{\mathrm{w}}}=\mathrm{C}_{\mathrm{m} \dot{\alpha}}\left(\mathrm{QS} \overline{\mathrm{c}} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{yy}}\right)\left(\bar{c} / 2 \mathrm{u}_{0}\right)$
$\mathrm{M}_{\mathrm{q}}=\mathrm{C}_{\mathrm{mq}}\left(\overline{\mathrm{c}}^{2} / 2\right) \mathrm{QS} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{yy}}$

### 8.2 Equations for lateral motion

$$
\begin{align*}
& \left(\frac{\mathrm{d}}{\mathrm{dt}}-\mathrm{Y}_{\mathrm{v}}\right) \Delta \mathrm{v}-\mathrm{Y}_{\mathrm{p}} \Delta \mathrm{p}+\left(\mathrm{u}_{0}-\mathrm{Y}_{\mathrm{r}}\right) \Delta \mathrm{r}-\mathrm{g} \cos \theta_{0} \Delta \varphi=\mathrm{Y}_{\delta \mathrm{r}} \Delta \delta_{\mathrm{r}}  \tag{6}\\
& -\mathrm{L}_{\mathrm{v}} \Delta \mathrm{v}+\left(\frac{\mathrm{d}}{\mathrm{dt}}-\mathrm{L}_{\mathrm{p}}\right) \Delta \mathrm{p}-\left(\frac{\mathrm{I}_{\mathrm{xz}}}{\mathrm{I}_{\mathrm{xx}}} \frac{\mathrm{~d}}{\mathrm{dt}}+\mathrm{L}_{\mathrm{r}}\right) \Delta \mathrm{r}=\mathrm{L}_{\delta \mathrm{a}} \Delta \delta_{\mathrm{a}}+\mathrm{L}_{\delta \mathrm{r}} \Delta \delta_{\mathrm{r}}  \tag{7}\\
& -\mathrm{N}_{\mathrm{v}} \Delta \mathrm{v}-\left(\frac{\mathrm{I}_{\mathrm{xz}}}{\mathrm{I}_{\mathrm{zz}}} \frac{\mathrm{~d}}{\mathrm{dt}}+\mathrm{N}_{\mathrm{p}}\right) \Delta \mathrm{p}+\left(\frac{\mathrm{d}}{\mathrm{dt}}-\mathrm{N}_{\mathrm{r}}\right) \Delta \mathrm{r}=\mathrm{N}_{\delta \alpha} \Delta \delta_{\alpha}+\mathrm{N}_{\delta \mathrm{r}} \Delta \delta_{\mathrm{r}} \tag{8}
\end{align*}
$$

In state space variable form (without control input) these equations appear as:

$$
\left(\begin{array}{c}
\Delta \dot{\mathrm{v}}  \tag{9}\\
\Delta \dot{\mathrm{p}} \\
\Delta \dot{\mathrm{r}} \\
\Delta \dot{\varphi}
\end{array}\right)=\left(\begin{array}{cccc}
\mathrm{Y}_{\mathrm{u}} & \mathrm{Y}_{\mathrm{p}} & -\left(\mathrm{u}_{0}-\mathrm{Y}_{\mathrm{r}}\right) & \mathrm{g} \cos \theta_{0} \\
\mathrm{~L}_{\mathrm{v}} & \mathrm{~L}_{\mathrm{p}} & \mathrm{~L}_{\mathrm{r}} & 0 \\
\mathrm{~N}_{\mathrm{v}} & \mathrm{~N}_{\mathrm{p}} & \mathrm{~N}_{\mathrm{r}} & 0 \\
0 & 1 & 0 & 0
\end{array}\right)\left(\begin{array}{c}
\Delta \mathrm{v} \\
\Delta \mathrm{p} \\
\Delta \mathrm{r} \\
\Delta \varphi
\end{array}\right)
$$

where,
$\mathrm{Y}_{\mathrm{p}}=\mathrm{QSbC}_{\mathrm{yp}} / 2 \mathrm{mu}_{0}$
$\mathrm{Y}_{\mathrm{r}}=\left(\mathrm{QS} / \mathrm{mu}_{0}\right)(\mathrm{b} / 2) \mathrm{C}_{\mathrm{yr}}$
$\mathrm{Y}_{\beta}=\mathrm{QSC}_{\mathrm{y} \beta} / \mathrm{m}$
$\mathrm{L}_{\mathrm{p}}=\mathrm{QSb}^{2} \mathrm{C}_{\mathrm{lp}}^{\prime} /\left(2 \mathrm{I}_{\mathrm{xx}} \mathrm{u}_{0}\right)$
$\mathrm{L}_{\mathrm{r}}=\mathrm{QSb}^{2} \mathrm{C}_{\mathrm{Ir}}^{\prime} /\left(2 \mathrm{I}_{\mathrm{xx}} \mathrm{u}_{0}\right)$
$\mathrm{L}_{\beta}=\mathrm{QSbC}_{1 \beta}^{\prime} / \mathrm{I}_{\mathrm{xx}}$
$\mathrm{N}_{\mathrm{p}}=\mathrm{QSb}^{2} \mathrm{C}_{\mathrm{np}} /\left(2 \mathrm{I}_{\mathrm{zz}} \mathrm{u}_{0}\right)$
$\mathrm{N}_{\mathrm{r}}=\mathrm{QSb}^{2} \mathrm{C}_{\mathrm{nr}} /\left(2 \mathrm{I}_{\mathrm{zz}} \mathrm{u}_{0}\right)$
$\mathrm{N}_{\beta}=\mathrm{QSbC}_{\mathrm{n} \beta} / \mathrm{I}_{\mathrm{zz}}$

### 8.3 Flight condition, mass and moments of inertia

In the present case,

$$
\begin{aligned}
& \mathrm{V}=\mathrm{u}_{0}=236.16 \mathrm{~m} / \mathrm{s} \\
& \mathrm{~W}=2,852,130 \mathrm{~N} \\
& \mathrm{~m}=290,737 \mathrm{~kg} \\
& \mathrm{~h}=40,000 \mathrm{ft} . \text { Hence, } \rho=0.3014 \mathrm{~kg} / \mathrm{m}^{3} \\
& \mathrm{~b}=59.74 \mathrm{~m} ; \bar{c}=10.2 \mathrm{~m} ; \mathrm{S}=550.5 \mathrm{~m}^{2} \\
& \mathrm{I}_{\mathrm{xx}}=24726520 \mathrm{~kg} \mathrm{~m}^{2} \\
& \mathrm{I}_{\mathrm{yy}}=44969660 \mathrm{~kg} \mathrm{~m}^{2} \\
& \mathrm{I}_{\mathrm{zz}}=67522420 \mathrm{~kg} \mathrm{~m}^{2} \\
& \mathrm{I}_{\mathrm{xz}}=1317918 \mathrm{~kg} \mathrm{~m}^{2} \\
& \mathrm{I}_{\mathrm{xz}}{ }^{2} / \mathrm{I}_{\mathrm{xx}} \mathrm{I}_{\mathrm{zz}}=0.00104(\text { Neglected }) \\
& \mathrm{Q}=\rho \mathrm{V}^{2} / 2=0.3014 \times 236.16 \times 236.16 / 2=8403.38 \mathrm{~N} / \mathrm{m}^{2}
\end{aligned}
$$

Hence, QS $/ \mathrm{mu}_{0}=0.06738, \mathrm{QS} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{yy}}=0.000436, \mathrm{QSb} / \mathrm{I}_{\mathrm{zz}}=4.086$, $\mathrm{QSb} / \mathrm{I}_{\mathrm{xx}}=11.158, \mathrm{QSb} / \mathrm{mu}_{0}=4.0183, \mathrm{QSb}^{2} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{zz}}=1.032$, $\mathrm{QSb}^{2} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{xx}}=2.818$.

### 8.4. Analysis of longitudinal motion

Using the values of various quantities:
$\mathrm{X}_{\mathrm{u}}=-\left(\mathrm{C}_{\mathrm{Du}}+2 \mathrm{C}_{\mathrm{D}}\right) \mathrm{QS} / \mathrm{mu}_{0}=-(0+2 \times 0.0392) 0.06738=-0.005282$
$\mathrm{Z}_{\mathrm{u}}=-\left(\mathrm{C}_{\mathrm{Lu}}+2 \mathrm{C}_{\mathrm{L}}\right) \mathrm{QS} / \mathrm{mu}_{0}=-(0.315+2 \times 0.616) 0.06738=-0.1042$
$\mathrm{M}_{\mathrm{u}}=\mathrm{C}_{\mathrm{mu}}\left(\mathrm{QS} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{yy}}\right) \overline{\mathrm{c}}=0.128 \times(0.000436 \times 10.2)=0.0005692$

## Remark:

The roots of the stability quartic or the eigen values of the stability matrix are sensitive to the value of $\mathrm{C}_{\mathrm{mu}}$. Results comparable with the roots in Ref. 3 were obtained when $\mathrm{C}_{\mathrm{mu}}$ value given in Ref. 3 is used.(See Table 3).

$$
\begin{aligned}
& X_{w}=-\left(C_{D \alpha}-C_{L}\right) \mathrm{QS} / \mathrm{mu}_{0}=-(0.446+0.616) 0.06738=-0.01145 \\
& Z_{w}=-\left(C_{L \alpha}+C_{D}\right) \mathrm{QS} / \mathrm{mu}_{0}=-(5.44+0.0392) 0.06738=-0.3692 \\
& \mathrm{M}_{\mathrm{w}}=\mathrm{C}_{\mathrm{m} \alpha}\left(\mathrm{QS} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{yy}}\right) \overline{\mathrm{c}}=-0.80(0.000436 \times 10.2)=-0.003558 \\
& \mathrm{M}_{\dot{\mathrm{w}}}=\mathrm{C}_{\mathrm{m} \alpha}\left(\overline{\mathrm{c}}^{2} / 2 \mathrm{u}_{0}\right)\left(\mathrm{QS} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{yy}}\right)=-6.87(10.2)^{2} /(2 \times 236.16) \times(0.000436)=-0.00066 \\
& \mathrm{M}_{\mathrm{q}}=\mathrm{C}_{\mathrm{mq}}\left(\overline{\mathrm{c}}^{2} / 2\right) \mathrm{QS} / \mathrm{u}_{0} \mathrm{I}_{\mathrm{yy}}=-20.17 \times 10.2^{2} / 2 \times(0.000436)=-0.4570
\end{aligned}
$$

From the

| above | -0.005282 | 0.01145 | 0 | -9.81 |
| :--- | :---: | :---: | :---: | :---: |
| quantities, the | -0.1042 | -0.3692 | 236.16 | 0 |
| stability | 0.0006374 | -0.003314 | -0.6127 | 0 |
| matrix for the | 0 | 0 | 1 | 0 |

longitudinal motion is:

The following Eigen values are obtained using MATLAB.
Short Period Mode ( $\eta_{\mathrm{s}} \pm \mathrm{i} \omega_{\mathrm{s}}$ )
$-0.4911+\mathrm{i} 0.8738,-0.4911-\mathrm{i} 0.8738$
$\eta_{\mathrm{s}}=-0.4911, \omega_{\mathrm{s}}=0.8738$
$\mathrm{T}_{1 / 2}=\ln (2) /\left|\eta_{\mathrm{s}}\right|=0.693 / 0.4911=1.41 \mathrm{~s}$
Period $=2 \pi / \omega_{\mathrm{s}}=6.28 / 0.8738=7.19 \mathrm{~s}$
$\mathrm{N}_{1 / 2}=\mathrm{T}_{1 / 2} /$ period $=1.41 / 7.19=0.196$ cycles
Long Period Mode or Phugoid Mode ( $\eta_{\mathrm{p}} \pm \mathrm{i} \omega_{\mathrm{p}}$ )
$-0.0025+\mathrm{i} 0.0753,-0.0025-\mathrm{i} 0.0753$
$\eta_{\mathrm{p}}=-0.0025, \omega_{\mathrm{p}}=0.0753$
$\mathrm{T}_{1 / 2}=\ln (2) /\left|\eta_{\mathrm{p}}\right|=0.693 / 0.0025=277.2 \mathrm{~s}$
Period $=2 \pi / \omega_{\mathrm{p}}=6.28 / 0.0753=83.40 \mathrm{~s}$
$\mathrm{N}_{1 / 2}=\mathrm{T}_{1 / 2} /$ period $=277.2 / 83.40=3.32$ cycles

## Remark:

The approximate analysis of Phugoid mode (Ref.10) gives $\eta_{\mathrm{p}}$ and $\omega_{\mathrm{p}}$ as:
$\eta_{\mathrm{p}} \approx \mathrm{X}_{\mathrm{u}} / 2 ; \omega_{\mathrm{p}} \approx \sqrt{\left(-\mathrm{Z}_{\mathrm{u}} \mathrm{g} / \mathrm{u}_{0}\right)}$
In the present case this would give $\eta_{\mathrm{p}} \approx-0.0026$ and $\omega_{\mathrm{p}} \approx 0.0667$. This cross check is seen to be roughly satisfied by the roots presented earlier.

### 8.5 Analysis of lateral motion

Using the values of various quantities yields :

$$
\begin{aligned}
& \mathrm{Y}_{\mathrm{p}}=\left(\mathrm{QS} / \mathrm{mu}_{0}\right)(\mathrm{b} / 2) \mathrm{C}_{\mathrm{yp}}=0.06738(59.64 / 2)(-0.1123)=-0.2256 \\
& \mathrm{Y}_{\mathrm{r}}=\left(\mathrm{QS} / \mathrm{mu}_{0}\right)(\mathrm{b} / 2) \mathrm{C}_{\mathrm{yr}}=0.06738(59.64 / 2)(-0.613)=-1.2316 \\
& \mathrm{Y}_{\beta}=\mathrm{QSC}_{\mathrm{y} \beta} / \mathrm{m}=8403.38 \times 550.5(-0.8492) / 290737=-13.512 \\
& \mathrm{~L}_{\mathrm{p}}=\left(\mathrm{QSb}^{2} / \mathrm{I}_{\mathrm{xx}} \mathrm{u}_{0}\right)\left(\mathrm{C}_{\mathrm{lp}}^{\prime} / 2\right)=(2.818)(-0.458 / 2)=-0.6453 \\
& \mathrm{~L}_{\mathrm{r}}=\left(\mathrm{QSb}^{2} / \mathrm{I}_{\mathrm{xx}} \mathrm{u}_{0}\right)\left(\mathrm{C}_{\mathrm{lr}}^{\prime} / 2\right)=(2.818)(0.4322 / 2)=0.6089 \\
& \mathrm{~L}_{\beta}=\left(\mathrm{QSb} / \mathrm{I}_{\mathrm{xx}}\right) \mathrm{C}_{\mathrm{l} \beta}^{\prime}=(11.158)(-0.2921)=-3.2593 \\
& \mathrm{~N}_{\mathrm{p}}=\left(\mathrm{QSb}^{2} / \mathrm{I}_{\mathrm{zz}} \mathrm{u}_{0}\right)\left(\mathrm{C}_{\mathrm{np}} / 2\right)=(1.032)(-0.0491 / 2)=-0.02533 \\
& \mathrm{~N}_{\mathrm{r}}=\left(\mathrm{QSb}^{2} / \mathrm{I}_{\mathrm{zz}} \mathrm{u}_{0}\right)\left(\mathrm{C}_{\mathrm{nr}} / 2\right)=(1.032)(-0.302 / 2)=-0.1558 \\
& \mathrm{~N}_{\beta}=\left(\mathrm{QSb} / \mathrm{I}_{\mathrm{zz}}\right) \mathrm{C}_{\mathrm{n} \beta}=(4.086)(0.1746)=0.7134
\end{aligned}
$$

The stability matrix for lateral motion is:
$\left|\begin{array}{cccc}-0.05722 & -0.00096 & -1.0052 & 0.04154 \\ -3.2593 & -0.6453 & 0.6089 & 0 \\ 0.7134 & -0.02533 & -0.1558 & 0 \\ 0 & 1 & 0 & 0\end{array}\right|$

The following Eigen values are obtained using MATLAB.
Dutch Roll $\left(\eta_{d} \pm i \omega_{d}\right)$
$-0.0198+\mathrm{i} 0.9162,-0.0198-\mathrm{i} 0.9162$
$\eta_{d}=-0.0198, \omega_{d}=0.9162$
$\mathrm{T}_{1 / 2}=\ln (2) /\left|\eta_{\mathrm{d}}\right|=0.693 / 0.0198=35.0 \mathrm{~s}$

Period $=2 \pi / \omega_{d}=6.28 / 0.9162=6.85 \mathrm{~s}$
$\mathrm{N}_{1 / 2}=\mathrm{T}_{1 / 2} /$ period $=35.0 / 6.85=5.11$ cycles
Roll mode
$\eta=-0.8143$
$\mathrm{T}_{1 / 2}=\ln (2) /|\eta|=0.693 / 0.8143=0.8510 \mathrm{~s}$
Spiral mode
$\eta=-0.00446$
$\mathrm{T}_{1 / 2}=\ln (2) /|\eta|=0.693 / 0.00446=155.4 \mathrm{~s}$
Remark: Based on Ref.10, the approximate value of the imaginary part of Dutch roll is $\sqrt{ }\left(\mathrm{N}_{\beta}\right)$, which in this case would be 0.8446 . This check is also roughly satisfied by the results presented earlier.
